

targilim

1.

get a String from the user (Scanner)
print Capital **if** all the letters are in upper **case**
print lower **if** all the letters are in lower **case**
create a function that gets as an input **2** strings and prints the longer string

2.

get an Int number from the user
create an array of **10** elements
place random numbers in the array
print True id the number from the user exist in the array

3.

create a function which gets **2** arrays and print the array in which the sum of elements is higher
i.e. : { **1, 3, 100** } and { **80, 90, 99** }
sum : **104** **269**
therfor will print the **2**snd array == { **80, 90, 99** } -- use Array.toString
